

Shikosha offers implants and implant-denture hybrids in comprehensive, customizable, digital, conventional, and TiBase options as a solution for edentulous patients. In addition to state-of-the-art implant technology, our Implant Department has an expert-level team that specializes in implant and hybrid technology and enjoys work-ing with clients to create the most optimal results possible. We offer both cementable and screw-retained abutment types as well as TiBase restorative options, and our Technical Director, Thomas Brumet, CDT, provides case consultation and treatment planning services: 503.238.7117.

SmileX Hybrid Implant Bundle

Our new & innovative hybrid custom abutment implant crown with bundled pricing is Shikosha's solution for all-inclusive implant restorations that pair exceptional quality with competitive pricing. Digitally-designed SmileX restorations integrate technology with artistry for customizable implant-supported crowns and all hybrid restorations. The bundled price includes the soft tissue model, analog, custom milled abutment, and our multi-layered full contour zirconia crown. Restorations are made in-house. All parts are FDA approved and the full manufacturer warranty applies to all original parts.

Implant Technology

Identica Hybrid Medit Scanner & Exocad Design Software

Shikosha's Identica Hybrid Medit Scanner is Medit's latest, most accurate scanner, representing the apex in 3D dental scanning with unsurpassed speed, accuracy and reliability. Scanning technology allows for scanning full articulators in large and complex implant cases. Exocad design software is open architecture and employs multiple scanning technologies.

Implants & Hybrids
implants@shikosha.com

FIXED HYBRID

There's more than one way to create a fixed hybrid. That's why our lab managers provide complimentary case consultation to help with choosing which type of solution is best for your patients. Benefits of fixed hybrids are: Small access holes; less intrusive; high esthetics; great stability; often don't require a flange.

MILLED BAR

Four to six implants are fabricated on a milled bar that is screwed into place, providing a solid design with zero movement. Benefits: Some milled bar options have passive attachments that snap into place; great stability; often don't require a flange.

ALL-ON-FOUR

A minimally invasive, fixed, full-arch solution that requires only four implants. Tilting the posterior implants avoids the need for bone grafting. Benefits: Great for full-arch cases; patients receive the prosthesis on the day of surgery; great stability; often don't require a flange.

OVERDENTURES

Overdentures are typically made with two to four implants and are held in place by locator attachments or a bar. Patients require a certain amount of bone and tissue integrity to help support the prosthesis. Benefits include: Removable by the patient; fewer implants means less surgery; lower cost and usually faster.
